SUBSTITUTED HETEROCYCLES AND THE USES THEREOF**Field of the invention**

The present invention relates to novel substituted heterocycles, their pharmaceutical compositions and methods of use. In addition, the present invention relates to therapeutic methods for the treatment and prevention of cancers.

Background of the invention

Chemotherapy and radiation exposure are currently the major options for the treatment of cancer, but the utility of both these approaches is severely limited by drastic adverse effects on normal tissue, and the frequent development of tumor cell resistance. It is therefore highly desirable to improve the efficacy of such treatments in a way that does not increase the toxicity associated with them. One way to achieve this is by the use of specific sensitizing agents such as those described herein.

An individual cell replicates by making an exact copy of its chromosomes, and then segregating these into separate cells. This cycle of DNA replication, chromosome separation and division is regulated by mechanisms within the cell that maintain the order of the steps and ensure that each step is precisely carried out. Key to these processes are the cell cycle checkpoints (Hartwell *et al.*, *Science*, Nov 3, 1989, 246(4930):629-34) where cells may arrest to ensure DNA repair mechanisms have time to operate prior to continuing through the cycle into mitosis. There are two such checkpoints in the cell cycle – the G1/S checkpoint that is regulated by p53 and the G2/M checkpoint that is monitored by the Ser/Thr kinase checkpoint kinase 1 (CHK1).

As the cell cycle arrest induced by these checkpoints is a crucial mechanism by which cells can overcome the damage resulting from radio- or chemotherapy, their abrogation by novel agents should increase the sensitivity of tumor cells to DNA damaging therapies. Additionally, the tumor specific abrogation of the G1/S checkpoint by p53 mutations in the majority of tumors can be exploited to provide tumor selective agents. One approach to the design of chemosensitizers that abrogate the G2/M checkpoint is to develop inhibitors of the key G2/M regulatory kinase CHK1, and this approach has been shown to work in a number of proof of

concept studies. (Koniaras *et al.*, *Oncogene*, 2001, 20:7453; Luo *et al.*, *Neoplasia*, 2001, 3:411; Busby *et al.*, *Cancer Res.*, 2000, 60:2108; Jackson *et al.*, *Cancer Res.*, 2000, 60:566).

Smithkline Beecham Corporation describes 2-ureidothiophene compounds in WO03029241 and 3-ureidothiophene compounds in WO03028731 as CHK1 inhibitors. The present invention provides novel CHK1 inhibitors with improved properties.

Summary of the invention

In accordance with the present invention, the applicants have hereby discovered novel compounds that are potent inhibitors of the kinase CHK1 and therefore possess the ability to prevent cell cycle arrest at the G2/M checkpoint in response to DNA damage. These compounds are accordingly useful for their anti-proliferative (such as anti-cancer) activity and are therefore useful in methods of treatment of the human or animal body. The invention also relates to processes for the manufacture of said compounds, to pharmaceutical compositions containing them and to their use in the manufacture of medicaments for use in the production of an anti-proliferative effect in warm-blooded animals such as man.

The present invention includes pharmaceutically acceptable salts or prodrugs of such compounds. Also in accordance with the present invention applicants provide pharmaceutical compositions and a method to use such compounds in the treatment of cancer.

Such properties are expected to be of value in the treatment of disease states associated with cell cycle arrest and cell proliferation such as cancers (solid tumors and leukemias), fibroproliferative and differentiative disorders, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, atherosclerosis, arterial restenosis, autoimmune diseases, acute and chronic inflammation, bone diseases and ocular diseases with retinal vessel proliferation.

Definitions

The definitions set forth in this section are intended to clarify terms used throughout this
25 application. In this section, the definition applies to compounds of formula (I) and (II) and compounds of formula (Ia) unless otherwise stated. The term "herein" means the entire application.

Unless specified otherwise within this specification, the nomenclature used in this specification generally follows the examples and rules stated in *Nomenclature of Organic*
30 *Chemistry, Sections A, B, C, D, E, F, and H*, Pergamon Press, Oxford, 1979, which is

- 27 -

incorporated by references herein for its exemplary chemical structure names and rules on naming chemical structures.

The term " C_{m-n} " or " C_{m-n} group" used alone or as a prefix, refers to any group having m to n carbon atoms.

5 As used in this application, the term "optionally substituted," means that substitution is optional and therefore it is possible for the designated atom to be unsubstituted. In the event a substitution is desired then such substitution means that any number of hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the normal valency of the designated atom is not exceeded, and that the substitution results in a stable
10 compound. For example when a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced. When a group is indicated to be "optionally substituted" or "substituted" unless otherwise expressly stated examples of suitable substituents include the following:
halogen, nitro, amino, cyano, trifluoromethyl, methyl, ethyl, alkyl, alkenyl, alkynyl, haloalkyl, alkoxy, hydroxy, alkylhydroxy, carbonyl, keto, -CH(OH)CH₃, -CH₂NH-alkyl-OH, alkyl-
15 (OH)CH₃, -Oalkyl, -OCOalkyl, -NHCHO, -N-(alkyl)-CHO, -NH-CO-amino, -N-(alkyl)-CO-amino, -NH-COalkyl, -N-(alkyl)-COalkyl, -carboxy, -amidino, -CO-amino, -CO-alkyl, -CO₂alkyl, mercapto, -Salkyl, -SO(alkyl), -SO₂(alkyl), -SO₂-amino, -alkylsulfonylamino, phenyl, cycloalkyl, heterocyclic and heteroaryl, -alkyl-NH-cycloalkyl, -alkyl-NH-optionally substituted heterocyclyl, -alkyl-NH-alkyl-OH, -C(=O)OC(CH₃)₃, -N(CH₃)₂, -alkyl-NH-alkyl-optionally
20 substituted heterocyclyl, alkyl-aryl, alkyl-polycyclyl, alkyl-amino, alkyl-hydroxy, -CH₂NH-alkyl-heterocyclyl, -CH₂NHCH₂CH(CH₃)₂. If the group to be substituted is a ring, the optional substituents could also be selected from: vicinal -O(alkyl)O-, vicinal -OC(haloalkyl)O-, vicinal -CH₂O(alkyl)O-, vicinal -S(alkyl)S- and -O(alkyl)S-. Each of these substituents can, themselves, be further substituted. Suitable examples of such further substitution include any of the foregoing
25 suitable substituents.

The term "hydrocarbon" used alone or as a suffix or prefix, refers to any structure comprising only carbon and hydrogen atoms up to 14 carbon atoms.

The term "hydrocarbon radical" or "hydrocarbyl" used alone or as a suffix or prefix, refers to any structure as a result of removing one or more hydrogens from a hydrocarbon.

- 28 -

The term "alkyl" used alone or as a suffix or prefix, refers to monovalent straight or branched chain hydrocarbon radicals comprising 1 to about 12 carbon atoms. Unless otherwise specified, "alkyl" general includes both saturated alkyl and unsaturated alkyl.

5 The term "alkenyl" used alone or as suffix or prefix, refers to a monovalent straight or branched chain hydrocarbon radical having at least one carbon-carbon double bond and comprising at least 2 up to about 12 carbon atoms.

The term "alkylene" used alone or as suffix or prefix, refers to divalent straight or branched chain hydrocarbon radicals comprising 1 to about 12 carbon atoms, which serves to links two structures together.

When cycloalkyl contains more than one ring, the rings may be fused or unfused and include bicyclo radicals. Fused rings generally refer to at least two rings sharing two atoms therebetween.

20 The term "cycloalkenyl" used alone or as suffix or prefix, refers to a monovalent ring-containing hydrocarbon radical having at least one carbon-carbon double bond and comprising at least 3 up to about 12 carbon atoms. When cycloalkenyl contains more than one ring, the rings may be fused or unfused and include bicyclo radicals.

The term "aryl" used alone or as suffix or prefix, refers to a hydrocarbon radical having one or more polyunsaturated carbon rings having aromatic character, (*e.g.*, $4n + 2$ delocalized electrons) and comprising 6 up to about 14 carbon atoms, wherein the radical is located on a carbon of the aromatic ring. Exemplary aryl includes phenyl, naphthyl, and indenyl.

25 The term "alkoxy" used alone or as a suffix or prefix, refers to radicals of the general formula $-O-R$, wherein $-R$ is selected from a hydrocarbon radical. Exemplary alkoxy includes methoxy, ethoxy, propoxy, isopropoxy, butoxy, *t*-butoxy, isobutoxy, cyclopropylmethoxy, allyloxy, and propargyloxy.

30 The term "carbocyclyl" is intended to include both alicyclic and aromatic ring structures wherein the closed ring is made of carbon atoms. These may include fused or bridged polycyclic

- 29 -

systems. Carbocyclyls may have from 3 to 10 carbon atoms in their ring structure, and often have 3, 4, 5, 6 and 7 carbon atoms in the ring structure. For example, "C₃₋₇ carbocyclyl" denotes such groups as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclopentadiene or phenyl.

5 A "heterocyclyl" is a saturated, partially saturated or unsaturated, mono or bicyclic ring containing 4-12 atoms of which at least one atom is chosen from nitrogen, sulphur or oxygen, which may, unless otherwise specified, be carbon or nitrogen linked, wherein a -CH₂- group can optionally be replaced by a -C(O)- and a ring sulphur atom may be optionally oxidised to form the S-oxides. Heterocyclyl may contain more than one ring. When a heterocyclyl contains more
10 than one ring, the rings may be fused or unfused. Fused rings generally refer to at least two rings sharing two atoms therebetween. Heterocyclyl may have aromatic character or may not have aromatic character. Examples of heterocyclyls include, but are not limited to, 1H-indazolyl, 2-pyrrolidonyl, 2H, 6H-1, 5,2-dithiazinyl, 2H-pyrrolyl, 3H-indolyl, 4-piperidonyl, 4aH-carbazolyl, 4H-quinolizinyl, 6H-1, 2,5-thiadiazinyl, acridinyl, azepanyl, azetidiny, aziridinyl, azocinyl,

 The term halogen includes fluorine, chlorine, bromine and iodine.

15 "Halogenated," used as a prefix of a group, means one or more hydrogens on the group are replaced with one or more halogens.

 "RT" or "rt" means room temperature.

 When any variable (e.g., R^1 , R^4 , R^a , R^e etc.) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at
20 every other occurrence. Thus, for example, if a group is shown to be substituted with 0-3 R^1 , then said group may optionally be substituted with 0, 1, 2 or 3 R^1 groups and R^1 at each occurrence is selected independently from the definition of R^1 . Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

 A variety of compounds in the present invention may exist in particular geometric or
25 stereoisomeric forms. The present invention takes into account all such compounds, including cis- and trans isomers, R- and S- enantiomers, diastereomers, (D)-isomers, (L)-isomers, the racemic mixtures thereof, and other mixtures thereof, as being covered within the scope of this invention. Additional asymmetric carbon atoms may be present in a substituent such as an alkyl group. All such isomers, as well as mixtures thereof, are intended to be included in this
30 invention. The compounds herein described may have asymmetric centers. Compounds of the

- 31 -

present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis from optically active starting materials. When required, separation of the racemic material can be achieved by methods known in the art. Many
5 geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended,
10 unless the specific stereochemistry or isomeric form is specifically indicated.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of
15 substituents and/or variables are permissible only if such combinations result in stable compounds.

When a circle is shown within a ring structure, it indicates that the ring system is aromatic.

As used herein, the phrase "protecting group" means temporary substituents which protect
20 a potentially reactive functional group from undesired chemical transformations. Examples of such protecting groups include esters of carboxylic acids, silyl ethers of alcohols, and acetals and ketals of aldehydes and ketones respectively. The field of protecting group chemistry has been reviewed (Greene, T.W.; Wuts, P.G.M. *Protective Groups in Organic Synthesis*, 3rd ed.; Wiley: New York, 1999).

25 As used herein, "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

- 32 -

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, maleic, tartaric, citric, ascorbic, palmitic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418, the disclosure of which is hereby incorporated by reference.

"Prodrugs" are intended to include any covalently bonded carriers that release the active parent drug according to formula (I) in vivo when such prodrug is administered to a mammalian subject. Prodrugs of a compound of formula (I) are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or in vivo, to the parent compound. Prodrugs include compounds of formula (I) wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug or compound of formula (I) is administered to a mammalian subject, cleaves to form a free hydroxyl, free amino, or free sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of formula (I), and the like.

- 33 -

"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

Compounds of formula (I) have been shown to inhibit checkpoint kinase activity in vitro.
30 Inhibitors of checkpoint kinase have been shown to allow cells to progress inappropriately to the

- 38 -

metaphase of mitosis leading to apoptosis of effected cells, and to therefore have anti-proliferative effects. Therefore it is believed that the compounds of formula (I) and their pharmaceutically acceptable salts may be used for the treatment of neoplastic disease as described above. In addition, compounds of formula (I) and their pharmaceutically acceptable salts are also expected to be useful for the treatment of other proliferative diseases. It is expected that the compounds of formula (I) would most likely be used in combination with a broad range of DNA damaging agents but could also be used as a single agent.

Generally, the compounds of formula (I) have been identified in one or both assays described below as having an IC_{50} or EC_{50} value of 100 micromolar or less. For example, the compound of example 263 has an IC_{50} value of 0.12 nM and the compound of example 97 has an IC_{50} value of 0.14 nM.

Checkpoint Kinase 1 Assay: This in vitro assay measures the inhibition of CHK1 kinase by compounds. The kinase domain is expressed in baculovirus and purified by the GST tag. Purified protein and biotinylated peptide substrate (Cdc25C) is then used in a 384 well automated Scintillation Proximity Assay (SPA). Specifically, peptide, enzyme and reaction buffer are mixed and aliquoted into a 384 well plate containing dilution series of compounds and controls. Cold and hot ATP are then added to initiate the reaction. After 2 hours, a SPA bead slurry, CsCl₂ and EDTA are added to stop the reaction and capture the biotinylated peptide. Plates are then counted on a Topcount. Data is analyzed and IC_{50} s determined for individual compounds.

Abrogation Assay: This cellular assay measures the ability of CHK1 inhibitors to abrogate the DNA-damage induced G2/M checkpoint. Compounds active against the enzyme (< 2 μ M) are tested in the cellular assay. Briefly HT29 cells (colon cancer cell line, p53 null) are plated in 96 well plates on day 1. The following day, cells are treated with camptothecin for 2 hours to induce DNA damage. After 2 hours, camptothecin is removed and cells are treated for an additional 18 hours with test compound and nocodazole, a spindle poison that traps in cells in mitosis that abrogate the checkpoint. Cells are then fixed with formaldehyde, stained for the presence of phosphohistone H3, a specific marker for mitosis and labeled with Hoechst dye so that cell number can be measured. Plates are scanned using the Mitotic Index protocol on the Array Scan (Cellomics). As a positive control for abrogation, 4 mM caffeine is used.

Compounds are tested in a 12-point dose response in triplicate. Data is analyzed and EC₅₀s determined for individual compounds.

Synthesis

5 The compounds of the present invention can be prepared in a number of ways well known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Such methods include, but are not limited to, those described below. All references cited herein
10 are hereby incorporated in their entirety by reference.

 The novel compounds of this invention may be prepared using the reactions and techniques described herein. The reactions are performed in solvents appropriate to the reagents and materials employed and are suitable for the transformations being effected. Also, in the description of the synthetic methods described below, it is to be understood that all proposed
15 reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. It is understood by one skilled in the art of organic synthesis that the functionality present on various portions of the molecule must be compatible with the reagents and reactions proposed. Such restrictions to the
20 substituents, which are not compatible with the reaction conditions, will be readily apparent to one skilled in the art and alternate methods must then be used.

 The starting materials for the examples contained herein are either commercially available or are readily prepared by standard methods from known materials. For example the following reactions are illustrations but not limitations of the preparation of some of the starting materials
25 and-examples used herein.

 General procedures for synthesizing the compounds of the invention are as follows:

 Compounds of Formula (I) can be synthesized from the general synthetic methods described below in Schemes 1-13. The first general method shown in both Scheme 1 and 1a utilize a Weinreb amide formation by reaction of either the trichloroacetyl-protected or free urea
30 (generated by reaction of the protected urea with ammonia in methanol) with an amino aluminate

- 40 -

organometallic complex. The urea can also be formed in one step by reaction of the unprotected amine with chlorosulfonyl isocyanate.

Scheme 1

Scheme 1a

In the case of compounds of formula (I) where R^3 is $NHC(O)NHR^4$; R^2 is $C(=O)R^6R^7$; and $X=S$; where Scheme 1) the starting materials are either purchased commercially or produced by a Gewald reaction of cyanoacetates with various benzaldehydes and elemental sulfur under basic conditions shown below in Scheme 2. If not commercially available, the corresponding aldehydes can be synthesized by DIBAL reduction of readily available esters.

- 41 -

**Scheme 2**

In the case of compounds of formula (I) where (R^2 is NHC(O)NHR^4 ; R^3 is $\text{C(=O)R}^6\text{R}^7$; and X=S ;) the 3-amino thiophene ester (Scheme 1a) is either purchased commercially or produced by the synthesis outlined below in Scheme 3. Reaction of DMF and POCl_3 and hydroxylamine yields the acrylonitrile, which is cyclized to the abovementioned 3-amino thiophene ester by reaction with a thioglycolate.

**Scheme 3**

In the case where (X=S , Y=N) or (X=O , Y=N), the amino esters can be generated through the three-step sequence shown below (Scheme 4) involving reductive removal of water from the commercially available oxime, followed by acylation and finally cyclization to the 2-amino-oxazole by reaction of the nitrile with HCl in dioxane or to the corresponding 2-amino-thiazole using Lawesson's Reagent.

**Scheme 4**

An alternate method for the generation of compounds of Formula (I) is described in Scheme 5 or 5a. This general route utilizes the same starting amino ester from Scheme 1 or 1a. The amide bond formation is executed from the reaction of the corresponding carboxylic acids (generated via hydrolysis of the ester in refluxing concentrated sodium hydroxide in methanol) with various amines. A variety of coupling agents can be used to effect this transformation including EDCI, DIC, BOP, and HATU under standard coupling methods very familiar to those practicing and trained in the art of organic synthesis. Generation of the final primary urea is then performed using a simple two-step reaction with trichloroacetylisocyanate followed by cleavage with ammonia in methanol. The urea can also be formed in one step by reaction of the amine with chlorosulfonyl isocyanate.

Scheme 5

Scheme 5a

As shown in the following Schemes 6-9 and 6a-9a, the amino amides in Scheme 5 or 5a can be used as a common intermediate for the formation of various substituted ureas and N-substituted guanidiniums. Reaction with isocyanates, acyl, or carbonyldiimidazole and amines, leads to the creation of various substituted ureas.

15 An additional general process presented in this invention involves the construction of general compounds with formula (I). The method, which employs a Suzuki Coupling of a 5-

- 45 -

bromo heterocycle intermediate as its key transformation, is shown in Scheme 10 and Scheme 10a. Commercially available amino esters are protected as the trichloroacetyl urea, followed by selective bromination at the 5-position with bromine in acetic acid or N-bromosuccinimide. Removal of the protecting group with ammonia in methanol followed by Weinreb amidation yields the advanced bromoheterocycle intermediate. Standard Suzuki reaction conditions are then employed to finally generate the target compounds. If not commercially available, boronic acids are synthesized by normal methods. The Weinreb amidation and Suzuki coupling steps can also be done in alternate order as shown in Scheme 10 or 10a. Finally, the bromo ester and bromo urea can both be utilized as a substrate in other Pd-mediated transformations such as Stille

5 Couplings with organotin reagents and Sonagashiri reactions with alkynes to produce compounds of Formula (I).

10

Scheme 10

- 46 -

Scheme 10a

Another method for obtaining compounds of Formula (I) utilizes a “reverse” Suzuki Coupling as displayed in Scheme 11 or 11a. A boronate ester of the heterocyclic scaffold is first generated through a Pd-mediated transformation of the bromo ureido amide (Scheme 10 or 10a) that involves an *in situ* formation of the iodide and subsequent boronation. This intermediate can be coupled to aryl halides or other reagents where L is a displaceable group under standard Pd coupling conditions. This invention allows for the synthesis of compounds of Formula (I) for which the corresponding aryl boronic acids or esters are not readily available for the penultimate transformation shown in Scheme 10 or 10a.

Scheme 11

- 47 -

Scheme 11a

5 Sulfonamide compounds of Formula (I) can be formed using the following general procedure outlined in Scheme 12, below. Sulfonamide formation by reaction of a desired amine with commercially available sulfonyl chlorides, followed by selective deprotonation, subsequent azidation, and reduction yields the amino sulfonamide intermediate. Reaction as before with trichloroacetylisocyanate and ammonia to generate a primary urea followed by a Suzuki Pd-mediated coupling gives the desired sulfonamide urea target molecules.

Scheme 12

15 Substitution adjacent to X with a nitrogen heteroatom ($R^1=NR^{11}R^{12}$) can be achieved using the procedure in Scheme 13 or 13a. This reaction can be accomplished by heating a bromo ureido amide (Scheme 10 or 10a) with a desired amine.

- 48 -

Scheme 13

Scheme 13a

- 5 If the compound generated from any of the above-mentioned synthetic methods or Schemes 1-13 (and 1a-13a) has a protecting group present anywhere on the molecule standard synthetic methods of removal and deprotection can be utilized to generate final compounds. The general method employed for the deprotection of a *tert*-butoxycarbonyl carbamate to yield the free amine product is to use a strong anhydrous acid such as HCl or TFA. This gives products of
- 10 Formula (I) as the corresponding hydrochloride or trifluoroacetate salt. Cleavages of methyl ethers to phenols or esters to acids are effected by reaction with the Lewis Acid boron tribromide (BBr₃) in methylene chloride. Cleavages of benzyloxycarbonyl carbamates or benzyl alcohols are effected by catalytic hydrogenation or the use of Lewis Acids such as BBr₃. These above methods are well known in the art of organic synthesis.

Example 1**5-Phenyl-2-ureido-thiophene-3-carboxylic acid (S)-azepan-3-ylamide**

methyl 2-amino-5-phenylthiophene-3-carboxylate. To a solution of phenylacetaldehyde (12.7 mL, 100 mmol) in DMF (150 mL) was added cyanomethyl acetate (8.9 mL, 100 mmol) and sulfur (3.2 g, 100 mmol), followed by diisopropylethylamine (Hunig's Base, 17.4 mL, 100 mmol). The resultant suspension immediately turned dark yellow to brown with an exotherm. The reaction mixture was stirred overnight at room temperature. The reaction was slowly added to water (~800 mL) while stirring. An off-white precipitate formed and was filtered after an additional 30 minutes of stirring. The resultant solid was purified by column chromatography (SiO₂, 10-20% EtOAc/ Hexanes) to yield 23.2g (100%) of the title compound as an off-white solid. ¹H NMR (d₆-DMSO, δ 7.5, br s, 2H; δ 7.45, m, 2H; δ 7.33, m, 2H; δ 7.24, s, 1H; δ 7.18, m, 1H; δ 3.73, s, 3H), LC/MS (APCI, ES, M+H=234).

2-amino-5-phenylthiophene-3-carboxylic acid. To a stirred solution of methyl 2-amino-5-phenylthiophene-3-carboxylate (13.0g, 55.7 mmol) in MeOH (400 mL) was added 6N NaOH (200mL) and water (100mL). The reaction was heated to reflux for 2h or until starting material was gone by TLC or LCMS. The solution was concentrated under vacuum to about half of the original volume. The pH of the resultant cloudy mixture was adjusted to 3-5 by the careful addition of 6N HCl (~300 mL) while stirring. The gummy red precipitate was filtered and dried. Purification was achieved by triturating in boiling hexanes. To a solution of methyl 5-benzyl-2-([(trichloroacetyl)amino]carbonyl)amino)thiophene-3-carboxylate (1.5 g, 3.5 mmol) in anhydrous THF (8.0 mL) was added via cannula a solution of [Me₃Al and (3*S*)-azepan-3-amine] in THF (preformed by the careful addition of Me₃Al (2.0M in hexanes, 3.6 mL, 7.1 mmol) to a solution of (3*S*)-azepan-3-amine (808 mg, 7.1 mmol) in 8.0 mL of THF at 0°C and subsequently stirring at rt for 10 mins). The resulting yellow solution was stirred at rt for 10 h. The reaction mixture was cooled to 0°C and a 10% aqueous solution of Rochelle's salt was added slowly to quench the reaction. The mixture was partitioned between EtOAc and H₂O, the aqueous layer was extracted with EtOAc (3x) and the combined organic extracts were washed with H₂O, brine and dried (MgSO₄). Evaporation gave a pale yellow solid. Purification by Gilson (5%-95% H₂O/MeCN) gave the title compound as an off- white solid. The hydrochloride salt was obtained by dissolving the title compound in a solution of 4.0N HCl in 1, 4-dioxane (10 mL) and stirring for 30 mins at rt. The cloudy solution was diluted with dry methanol and the solvents were removed under vacuum. The residue was dissolved in H₂O and placed in a lyophilizer to yield the title compound as white solid. ¹H NMR (300 MHz, DMSO-d₆) δ ppm 0.90 - 1.89 (m, 6 H) 2.90 - 3.65 (m, 4 H) 3.76 - 3.87 (m, 1 H) 6.54 (s, 2 H) 7.14 - 7.41 (m, 6 H); LC/MS (ES, M+H=473).

A stirred solution of methyl 5-phenyl-2-({[(trichloroacetyl)amino]carbonyl}amino)thiophene-3-carboxylate (63.44 g, 150 mmol) in anhydrous methanol (300 mL) was purged with dry ammonia for 20 mins. 2-[(aminocarbonyl)amino]-N-[(3R)-1-azabicyclo[2.2.2]oct-3-yl]-5-phenylthiophene-3-carboxamide. To a solution of methyl 2-[(aminocarbonyl)amino]-5-phenylthiophene-3-carboxylate (1.37 g, 5 mmol) in anhydrous THF (15 mL) was added via cannula a solution of [Me₃Al and (3R)-quinuclidin-3-amine] in THF (preformed by the careful addition of Me₃Al (2.0M in hexanes, 5 mL, 10 mmol) to a solution of (3R)-quinuclidin-3-amine (1.0 g, 5 mmol) in 10 mL of THF at 0°C and subsequently stirring at rt for 10 mins). The resulting yellow solution was stirred at rt for 10 h. The reaction mixture was cooled to 0°C and a 10% aqueous solution of Rochelle's salt was added slowly to quench the reaction. The mixture was partitioned between EtOAc and H₂O, the aqueous layer was extracted with EtOAc (3x) and the combined organic extracts were washed with H₂O, brine and dried (MgSO₄). 3-amino-5-(4-chlorophenyl)thiophene-2-carboxylic acid. To a stirred solution of methyl 3-amino-5-(4-chlorophenyl)thiophene-2-carboxylate (10.0g, 37.3 mmol) in MeOH (40 mL) was added 50% w/w solution of NaOH (20 mL). The resulting viscous solution was heated to reflux for 2 h whereupon it was cooled to rt. The mixture was treated cautiously with 2N HCl solution until pH~3. The aqueous phase was washed exhaustively with EtOAc (5x) and dried (MgSO₄). Evaporation gave the title acid as pale yellow solid. The product was used in the next step without any further purification: LC/MS (ES, M+H=254).

To a solution of 3-amino-5-(4-chlorophenyl)thiophene-2-carboxylic acid (5.0 g, 19.7 mmol) in dry DMF (40 mL) were added *tert*-butyl (3S)-3-aminopiperidine-1-carboxylate (3.95g, 19.7 mmol) and HATU (15.0g, 39.4 mmol) at 0°C. The resulting pale orange solution was stirred for 10 mins at this temperature whereupon *N,N'*-diisopropylethyl amine (7.8 mL, 43.3 mmol) was added drop-wise via a syringe. After the addition finished, the resulting orange

solution was warmed to rt and stirred overnight. The mixture was partitioned between EtOAc and H₂O and the organic layer was washed with brine, H₂O and dried (MgSO₄). Evaporation gave a yellow oil. Purification by Biotage-Horizon system™ (30%EtOAc→45%EtOAc-hexanes) gave the desired product. ¹H NMR (300 MHz, DMSO-d₆) δ ppm 1.39 (s, 9 H) 1.40 - 1.45 (m, 1 H) 1.46 - 1.62 (m, 1 H) 1.63 - 1.73 (m, 1 H) 1.76 - 1.87 (m, 1 H) 2.65 - 2.78 (m, 2 H) 3.68 - 3.82 (m, 3 H) 6.53 (s, 2 H) 6.98 (s, 1 H) 7.31 (d, *J*=6.97 Hz, 1 H) 7.49 (d, *J*=8.00 Hz, 2 H) 7.61 (d, *J*=8.00 Hz, 2 H); LC/MS (ES, M+H=436).

piperidin-3-ylamide. To a solution of *tert*-butyl (3*S*)-3-({[3-amino-5-(4-chlorophenyl)-2-thienyl]carbonyl}amino)piperidine-1-carboxylate (1.0 equiv) in THF (0.5 M) was added 3,4-dimethoxy-phenyl isocyanate (1.1 equiv). The resulting light brown solution was stirred at rt for 2 h whereupon the solvent was evaporated. The residue was treated with 4.0N HCl solution in dioxane (0.5 mL) and the resulting cloudy mixture was stirred at rt for 1 h. Evaporation of the solvent followed by purification by Gilson (20%MeCN-H₂O→98%MeCN-H₂O) gave the desired product. ¹H NMR (300 MHz, DMSO-d₆) δ ppm 1.56 - 1.76 (m, 2 H) 1.83 - 2.03 (m, 2 H) 2.72 - 2.98 (m, 2 H) 3.15 - 3.35 (m, 2 H) 3.39 (s, 6 H) 4.10 - 4.27 (m, 1 H) 7.47 (d, *J*=8.29 Hz, 2 H) 7.54 (d, *J*=8.00 Hz, 1 H) 7.62 - 7.77 (m, 3 H) 7.87 (d, *J*=8.29 Hz, 2 H) 8.07 (s, 1 H) 8.39 (d, *J*=7.54 Hz, 1 H) 8.91 - 9.05 (m, 2 H); LC/MS (ES, M+H=516).

Example 244**N-(5-phenyl-3-[(3*S*)-piperidin-3-ylamino]carbonyl)-2-thienyl)hydrazinecarboxamide**

To a solution of *tert*-butyl (3*S*)-3-[(2-amino-5-phenyl-3-thienyl)carbonyl]amino}piperidine-1-carboxylate [prepared as in Example 15] (200 mg, 0.5 mmol) in THF (1.0 mL) was added 1,1'-carbonyl diimidazole (240 mg, 1.5 mmol). The resulting cloudy solution was stirred at rt for 1 h whereupon a solution of NH₂NH₂ in THF (200 μ L in 1 mL of THF) was added and the resulting dark solution was stirred for 10 h at rt.
